                                                                                                                                                                                                                                                                                                1 IFPKQYPIINFTTAGATVQSYTNFIRAVRGRLTTGADVRHEIPVLPNKVGLPINQRFILV 60
                                                             The invention covers analogues of Type I RIPs. Ricin is a Type II RIP whose A chain is homologous to plant type I RIPs. The analogues of the invention have a cysteine available for intermolecular disulphide bonding at an amino acid position corresp. to a position not naturally available for bonding; the cys residue is located in the C-terminal region of the analogue between a position corresp. to amino acid 251 and the C-terminus of ricin A chain. The analogues are pref. joined via a disulphide linkage to a molecule which specifically binds to a target cell, e.g. an antibody fragment.

                                                                                                                                                                                               Which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host
                                                                                                                                             AAR63902 is the ricin A chain gene product, it is analogous to the ribosome-inactivating proteins (RIPs) described in AAR63903-R63911
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ricin A-chain ribosome inhibitory protein inactive precursor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                             AAW25136 represents a Ricin A-chain ribosome inhibitory protein (RIP)
which was engineered to contain a selectively removable internal peptide
linker sequence separating the alpha and beta units of the RIP. When
separated the two units regain and test and is of the RIP. When
separated the two units regain and beta units of the RIP. When
cukaryotic ribosomes and hence preventing protein production. Many
different RIPs may be produced with an internal linker including
maize RIP, Trichosanthin, Ricin A-chain, Abrin-A A-chain and
Saporin. The RIPs can be used in the construction of therapeutic
toxins targeted to specific cells such as tumour cells via the
tatachment of a targeting polypeptide, e.g. a monoclonal antibody.
A further use is in HIV therapy (see U54869903). There is interest
in expressing RIP recombinantly in host eukaryotic cells, because of
the capacity to provide correct post-translational processing. However,
RIPs effectively inhibit protein synthesis in eukaryotic cells resulting
in cell death. Since the inactive RIP proteins are not cytotoxic to
cukaryotic cells, they can be recombinantly expressed in such cells and
then converted to active RIP proteins.

The sequences given in AAW21698-710 represent Ribosome Inactivating Proteins (RIP's), which may be used in the construction of the proteins possible invention. The proRIP has a selectively removable, internal peptide linker. The procursor sequence is incapable of inactivating eukaryotic ribosomes, but can be converted by removal of the linker into a protein having alpha and beta fragments and being capable of inactivating eukaryotic ribosomes. RIPs are potent inhibitors of eukaryotic protein synthesis. They possess a highly specific N-glycosidaes activity which cleaves the glycosidic bond of adenine 4324 of rat liver ribosomal 285 RNA. RIP's selectively inhibit cellular proliferation of cells, e.g. cancer cells and HIV-infected T cells. The inactive proteins make it possible to provide protein possible. The RIP can be used to make cytotoxic conjugates.

The full-length sequences encoding ricin A (AAN70520), ricin D (AAN70525), putative ricin E (AAN70526) and RCA (AAN70524) in precursor form were obten using messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70521, AAN70522) shows the nucleotide sequences of three plasmids contg. CDNA inserts obtain a CDNA library for sequences encoding ricin B using the probe in AAN70517. The CDNA inserts can be placed into expression vectors. Site-directed mutagenesis may be used to place an ATG start codon and a Hindlif site at the beginning of the mature protein (see AAN70518). The coding sequences of the inserts can be ligated into expression coding sequences of the inserts can be ligated into expression (vectors contg. the PhoA promoter-operator and leader sequence (AAN70523) and sultable retroregulators.

The immunotoxin given in AAR70827 comprises the heavy and light chain variable regions of anti-lens epithelium IgG3 MAb 4197X linked to ricin-A and a hexa-histatidine tag. The DNA construct encoding the immunotoxin was expressed from pHB19 in E. Coli. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

AAN90068) found on the EcoRI-HindIII fragment of DNA from Ricinu communis, Zanibariensis variety. Patent discloses many modifications of ricin in which the lectin binding function of the B chain is diminished or removed, and conjugation to toxins to eliminate cell binding. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI field.)

Proricin is obtained from preproricin by removal of the AA leader sequence. The linker AA sequence which is present in the precursor polypeptide is enzymatically removed in the cell to separate the A and B chains, which are joined by a disulphide bridge during the formation of the ricin molecule itself. This linker region as well as the presumptive amino terminal leader or signal sequence are not present in the sequences already published by Funatsu et al.

The sequence relates to preproricin protein encoded by the DNA sequence given in AAA64137. The invention relates to a novel toxin (e.g., ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide nor-toxic to uninfected cells. The invention has anti-HIV and virucide ribosomes and enhancement of binding of the antiviral agent to galacrose residues on cell surfaces, and its cellular internalisation. The residues on cell surfaces, and its cellular internalisation. The and other viral infections, especially retroviral infections and other viral infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-stage infected antiviral agent is activated in viral particles or early-stage infected integration of the viral genome into the host genome thereby preventing the latency/rebound problem. The agent enters all HIV susceptible cells, and one just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell until degraded in it, unless the cell is infected with the virus, where the viral protease activates it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         52 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 111

The sequence relates to the amino acid sequence of a modified preproricin protein encoded by AAI64145. The invention relates to a novel toxin protein encoded by AAI64145. The invention relates to a novel toxin coin calcin based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. The agent is able to enter all HIV susceptible cells, and not just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell unless the cell is infected with the HIV virus, where the viral protease activates it. Ricin's mechanism of action is through inactivation of cellular ribosomes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             85 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITFLFTDVQNRYTFAFG 144

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              enhancement of binding of the antiviral agent to galactose residues on cell suxfaces, and its callular internalisation. The invention is useful for treating human immunodeficiency virus infection and other viral infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-estage infected cells, Killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     25 IFPKQYPIINFTTAGATVQSYTNFIRAVRGRLTTGADVRHEIPVLPNRVGLPINQRFILV 84

The full length sequences encoding ricin A (AAN70520), ricin D (AAN70525) putative ricin E (AAN70526) and RCA (AAN70524) in precursor form were obtained, using the messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70521, shows the nucleotide sequences of three plasmids containing cDNA inserts obtained by probing a cDNA library for sequences encoding ricin B using the probe in AAN70517. The cDNA contagenesis may be used to place an ATG start codon and a Hindlif site at the beginning of the mature protein, (see AAN70518). The coding sequences of the inserts can be ligated into expression vectors containing the PhoA promoter-operator and leader sequence (AAN70523) and suitable retroregulators.

DNA (see ALT91638) encoding the enzymatic A domain and a portion of the A-to-B linker peptide of ricin was used to construct a ricin-diphtheria toxin B' interleukin-2 gene that was expressed in E. coli. The hybrid protein can be isolated and used to treat conditions involving over-production of cells bearing IL2 receptors, such as certain T-cell lymphomas and organ transplant rejection crises. The hybrid inactivates ribosomes in cells bearing IL2 receptors, resulting in cessation of protein synthesis and death of target cells. Claimed hybrid proteins comprise a translocation of penalty and a cell binding domain from e.g. a hormone, growth factor or polypeptide toxin. The hybrid molecules can be used for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New hybrid molecules for delivery of agents to cells - comprise binding domain of a cell binding ligand and a portion of a translocation domain of a protein

delivery of agents (e.g. therapeutic genes, toxins, detectable labels) into cells. The use of a translocation mechanism ensures that the hybrid will be effective in relatively low doses, since a high proportion of the substance of interest will be taken into the targeted cells. The hybrid molecules can be manufactured as a single hybrid recombinant protein, permitting reproducibility, consistency, and the precise control of composition.

therapy to affected cells, allowing them to function properly and alleviate or cure the disease. The hybrid is especially used in treating genetic deficiency diseases, by delivering to affected cells an enzyme supplying the missing function, to supplementing cellular levels of a particular enzyme or a scarce precursor or cofactor, to directing toxins or other poisons to destroy particular cells (such as adipocytes, cancer cell, or virus infected-cells), to counteracting viral infections such as HIV, by introducing appropriate antibodies to viral proteins. It is also involved in the process of getting non-therapeutic substances such as detectable labels into cells. The invention relates to a recombinant DNA molecule encoding a hybrid protein comprising three parts: (a) the first part comprises a portion of the binding domain of a cell-binding polypeptide ligand allowing the hybrid protein to bind to an animal cell; (b) the second part comprises a portion of a translocation domain of a naturally occurring protein toxin, an expected from diphtheria toxin, botulinum neurotoxin, ricin, cholera toxin, which translocate the third part of the across the cytoplasmic membrane into the cytosol of the cell; and (c) the third part comprises a polypeptide entity to be introduced into the cell, which is non-native to the naturally occurring protein of (b). This sequence represents the castor bean ricin toxin sequence for use in generating the hybrid of the invention. The hybrid molecule enables the direction of appropriate

Patent No. 5837491
GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Studnika, Gary M.
TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating NUMBER OF SEQUENCES: 173
CORRESPONDENCE ADDRESS:
                              10;
  Pred. No. 2.7e-102;
0; Mismatches 0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SOFTWARE: PatentIn Release #1.0, Version #1.25

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C; Comment: Abrin-a is more toxic than ricin. The toxin consists of an A chain, which inh taining receptors on the cell surface. The A and B chains are linked by a single disulfice; Superfamily: ricin; rRNA N-glycosidase homology
C; Reywords: duplication; glycoprotein; glycosidase; hydrolase; lectin; pyroglutamic acid; F; 1-251, Product: abrin-a chain A #status experimental ACH>
F; 246, Domain: rRNA N-glycosidase homology < RNG>
F; 261-528/Product: abrin-a chain B #status experimental ACH>

**Analysis of several key active site residues of ricin A chain by

**Tay Crystallography.";

**Protein Eng. 5:775-779(1992).

**C. !- FUNCTION: Ricin is higly toxic to animal cells and to a less

**Extent to plant cells. The A chain is responsible for inhibiting

protein synthesis through the catalytic inactivation of 608

**Tibosomal subunits. It acts as a glycosidase that removes a

specific adenine residue from an exposed loop of 288 ribosomal

RNA. As this loop is involved in the binding of elongation

factors, the modified ribosomes are unable to support protein

synthesis. The A chain can inactivate a few thousand ribosomes

per minute, thus inactivating them faster than the cell can make

new ones. A single A-chain molecule can therefore kill an animal

cell. The B chain binds to cell receptors and facilitates the

cell. The cell of the A chain; B chains are also responsible
